Junior AI/ ML Engineer Assignment
ID Document Forgery Detection

Objective

Build a prototype that analyzes an uploaded ID document image and generates a forgery risk report indicating whether the document appears genuine or suspicious. The focus is not on perfect accuracy, but on evaluating your problem understanding, approach to fraud detection, use of AI tools, and reasoning.

Requirements

Develop a small service that:

1. Accepts an image of an ID document
2. Validates the image type
3. Analyzes the image to detect potential tampering
4. Generates a structured fraud detection report
5. Displays the report in a clear format

Deliverables

- GitHub repository link
- A brief document outlining the approach, architecture, and tools used
- Sample input(s) along with corresponding output report(s)
- Clear instructions to run and test the application

Evaluation Criteria

- Understanding of the problem
- Approach to fraud detection
- Effective use of AI/ML tools
- Clarity of reasoning and reporting
